

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The Packet Analyzer log shows us that the website yummyrecipesforme.com is unreachable. The analyzer receives an ICMP error code "Unreachable" on UDP Port 53. This may indicate a problem with server configuration, firewall configuration, or the DNS server might be down

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

The incident occurred at 1:24PM with several customers/clients reporting that they were not able to access the client company website www.yummyrecipesforme.com, and saw the error "destination port unreachable" after waiting for the page to load. The security team responded and began analyzing and testing the company website with a network analyzer called TCPDump. After the analyst recreated and tested the issue, the resulting logs presented that the UDP Port 53 which is used to handle DNS requests is not reachable. Security teams and engineers are continuing the investigation to investigate the root cause of the issue and determine the resolution for the incident. Our next steps is to investigate the DNS Server connection and services, firewall rules and configuration, and collaborating with administrator of the DNS server for possible sign of attacks
